expression pattern of the microarray. The polynucleotides and polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; ovarian antigen; ovary; ovarian; breast; cancer; tumour; ovarian cancer: breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; infection; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy, chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABG54131-ABG56305), and also encompasses polypeptides 90% identical and polybrucleotides 93% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen conversion antigen bolymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tundurs of ovarian or breast origin; reproductive system clisorders (e.g., infertinity, disorders of pregnancy, anovulation, polycystic ovary syndrome; ovarian cysts, and dysmenorthoea), endocrine disorders, infections (e.g., chlawydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vaginitis), immune disorders (e.g., congenital and acquired cancer, and unimary system disorders (e.g., anaemia), cardiovascular disorders (blood-related disorders (e.g., anaemia), cardiovascular disorders (c.g., anaemia), cardiovascular disorders (c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ,

The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (1) selected from a polypeptide having a sequence selected from 254 sequences (ABP5121-ABP51464) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (1) or a biologically active or naturally occurring polypeptide comprising a sequence compound for effectiveness as an agonist or antagonist, for screening a compound for effectiveness as an agonist or antagonist, for screening a compound for preparing a polyclonal or monoclonal antibody by hybridom a technology.

**Compound for effectiveness in altering expression of a target completed comprising. Oligonucleotides and antibodies are useful for screening acompound for effectiveness in altering expression of a target compound, or a diagnostic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (1) in a sample, and for purifying (1) from a sample. A composition comprising (1), and agonist or antagonist is useful for treating a disease or condition or associated with aberrant expression of MDDT, where the disorders are cirrhosis, hepatitis for disease, pression of functional MDDT. (1) or (11) are useful for diagnosing, treating a disease or condition or selected from a cell proliferative disorder such as arteriosclerosis, cirrhosis, hepatitis, popifical such as ADDS, Addison's disease, as selected arthritis. (11) are useful for creating whockin humanised contained animals a transgenic animals to remove the remover of a ringer of a remover of animals or transgenic animals to remove the arrance of a ringer of a remover of animals of a ringer or animals a remansement of a remover of a remover of a remover of a ringer of a remover of a ringer of a remover of a ringer of a ringer of a ringer of a ringer of a remover of a remover of a ringer of a remover of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic
                                                                                                                                                                                                                                                                          Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders e.g. arteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g.

The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (1) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) especially as expressed sequence tags for identifying expressed genes therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     96
                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ675-ABI30511), expressed DNA sequences (ABIJ6175) and the encoded proteins (ABBS7077-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, archritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences Length 208; Query Match Best Local Similarity

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGF) primers, and for chomosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites way aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patient did not appear in the printed specification, but was obtained in electronic format directly from WHOO at the printed specification, but was obtained in electronic format directly from WHOO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               310 PALDVDWQSNNTFASCSTDMCIHVCKLGQDRPIKTFQGHTNEVNAIKWDPTGNLLASCSD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR22568-ABRES903 and ACC66010-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            50 ISIIQKGLQYVEAEVSINEDG---TLFDGRPIESLSLIDAVMPDVVQTRQQAYRDKLAQQ 106
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    107 QAAAAAAAAAAAAAYOGSAKNGENTANGEENGAHTIANNHTDMMEVDGDVEIPPNKAVVLR 166

```

```
The invention relates to 45 human intracellular signalling molecules
(INTSIG), INTSIG-1 to INTSIG-45, and the CDNAs encoding them (ADA13319-
CADA13408). The invention also encompasses expression constructs, host
cells and transgenic organisms comprising an INTSIG nucleic acid sequence
; the recombinant preparation of a INTSIG; an antibody against a INTSIG;
cethods of detection of INTSIG proteins or nucleic acids; amicro-array
containing INTSIG nucleic acids, methods of screening compounds for their
compositions comprising an INTSIG protein, an INTSIG antibody, an INTSIG
agonist or INTSIG attagonist. The INTSIG proteins, nucleic acids or
compositions comprising them are useful in diagnosing, treating or
compositions comprising them are useful in diagnosing, treating or
compositions them are useful in diagnosing, treating or
compositions the area of disorders, including call profiferative disorders
(e.g., AIDS, allergies, anaemia, asthma, bronchitis, gout, multiple
compositions comprising the arthritis, repless, strucke,
compositions dementia, or Parkinson's disease); viral, bacterial,
diagnosia, parasitic, protozoan or helminthic infections, neurological
dispressions, cancer or allowed the composition or helminthic infections in neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fungal, parasitic, protozoan or helminthic infections; neurological disorders (e.g., epilepsy, stroke, Alzheimer's disease, dementia, or Parkinson's disease), developmental disorders (e.g., achondroplastic dwarfism, Cushing's disease, hypothyroidism or hydrocephalus; endocrine disorders (e.g., disorders of the hypothalamus or pituitary gland or diabetes); reproductive disorders; or vesicle-trafficking disorders (e.g., cystic fibrosis or hypercholesterolaemia). The present sequence
diagnosing, treating and preventing diseases or conditions associated with the aberrant INTSIG expression e.g. cancer, diabetes, epilepsy, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      represents an INTSIG protein of the invention.
                                                                                                                       Claim 1; Page 225-226; 367pp; English.
                                                              infections.

Drosophila melanogaster polypeptide SEQ ID NO 13572.

SAKNGENTANGEENGAHTIANNHIDMMEVDGDVEIPPNKAVVLRGHESEVFICAMNPVSD 182 TGEAKQQFPFHSAPALDVDWQSNNTFASCSTDMCIHVCKLGQDRPIKTFQGHTNBVNAIK 356 PNAN---LMLASASFDSTVRLWDVDRGICIHTLTKHQEPVYSVAFSPDGRYLASGSFDKC 465 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences LMVSASEDATIRIWDFETGEYERSLKGHTDSV-----QDVA-----FDAQGK LLASCSADLSIKLWDFQQSYECIKTMHGHDHNVSSVAFVPAGDYVLSASRDRTIKMWEVA VHIEGSIFATCSNDQTIRVWLTNSKDCKVELRDHEHTVECIAWAPEAAASAINEAAGADN **EELNQAIADYLGSNGYADSLETFRKEADLSTEVEKKFGGLLEKKWTSVIRLQKKVMELEA** EVSINEDGTLFDGRPIESLSLIDAVMPDVVQTRQQAYRDKLAQQQAAAAAAAAAAASQQG LLASGSGDSTARIWNLS----ENSTSGSTQLVLRHCIREGGQDVPSNKDVTSLDWNSEGT LLATGSYDGFARIW--TKDGNLASTLGQHKGPIFALKWNKKGNFILSAGVDKTTIIWDAH 357 WDPTGNILLASCSDDMTLKIWSMKQDNCVHDLQQHNKEIYTIKWSP------TGPGTNN DEVNFLVYRYLQESGFSHSAFTFGIKSHIS---QSNINGALVPPAALISIIQKGLQYVEA Drosophila, developmental biology; cell signalling; insecticide; pharmaceutical.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a TZap protein. The TZap gene is involved in T cell activation, and in the modulation of immune responses. TZap papelyndles are useful for diagnoshing or treating acute and chronic diseases involving T cell activation and Thl and TLD immune response, for the treatment of acute and chronic rejection of alloand xend organ transplants and bone marrow transplantation, for the treatment of rheumatoid arthritis, lupus erythematosis, multiple sclerosis, encephalitis, vasculitis, diabetes mellitus, multiple sclerosis, thyroiditis, for the treatment of malignant disorders of T, B or NK cells, for the treatment of malignant disorders of T, B or NK cells, for the treatment of skin themours, adrenal tumours or lung tumours, wound healing, growth disorders

The present invention describes primer sets for synthesising 5602 full-
length CDMAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonuclectide comprises as least 15 nucleotides; or. (b) a combination of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence of an another comprises a 1'-end sequence of 2'-end sequence 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDMAs. The primers are also useful for the particularly full-length cDMAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the full-length cDMAs. The primers are also useful for the contains encoded by the full-length cDMAs. The primers are also useful for the contains and another and sequences, and AAH13622 to AAH13622 represent human amino acid sequences; and AAH13622 to AAH13622 represent contains and the exemplification of the contains and the exemplification of the contains and the exemplification of the contains and the exemplification of the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and the contains and contains and contains and contains and contains and contains and contains and co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           170 KLASGCKNGQILLWDPSTGKQVGRTLAGHSKWITGLSWEPLHANPECRYVASSSKDGSVR 229

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WD-40 repeat protein [imported] - Nostoc sp. (strain PCC 7120)

C;Species: Nostoc sp. PCC 7120

A;Note: Nostoc sp. strain PCC 7120

A;Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120

C;Date: 14-Dec-2001

C;Date: 14-Dec-2001

A;Title: Complete Genomic Sequence of the Filamentous Nitrogen-fixing Cyanobacterium Anal A;Reference number: AB1807; MUID:21595285; PMID:11759840
WD-40 repeat protein [imported] - Nostoc sp. (strain PCC 7120)
C;Species: Nostoc sp. PCC 7120
A;Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120
C;Date: 14-Dec-2001 #sequence_revision 14-Dec-2001 #text_change 09-Dec-2002
C;Accession: AD1842

"Complete genomic sequence of the filamentous nitrogen-fixing cyanobacterium Anabaena sp. strain PCC 7120.";
DNA Res. 8:205-213(2001).
-i- SIMILARITY: Contains 16 WD repeats.
-i- SIMILARITY: Contains 1 pentapeptide repeat domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 1526;

Neurology 57:416-422(2001).

-!- FUNCTION: Probably involved in nuclear migration during cell division. Participates in the process of neuronal cell division. Participates in the process of neuronal cell division. Participates in the process of neuronal cell differentiation or brain development, possibly by through its role in nuclear migration of differentiating neurons. May participate in nargeting cytoplasmic dynain to the microtubule plus ends, thereby playing an essential role in dynein-mediated microtubule sliding. Non-catalytic subunit of a acetylhydrolase complex, a complex that inactivates platelet-activating factor (PAF) by removing the acetyl group at the SN-2 position.

-!- SUBUNT: Cytosolic PAF-AH IB is formed of three subunits of 45 kDa (alpha), 30 kDa (beta) and 29 kDa (gamma). The catalytic activity of the enzyme resides in the beta and gamma subunits, whereas the alpha subunit has regulatory activity. Trimer formation is not essential for the catalytic activity. Interacts with dynein and dynactin. Interacts with RSN.

-!- SUBCELLULAR LOCATION: Cytoplasmic, localizes to the plus end of
                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=20512525; PubMed=11056532;

DISBASE: Defects in PARAHIBI are a cause of Miller-Dieker

DISBASE: Defects in PARAHIBI are a cause of Miller-Dieker

Lissencephaly syndrome (MDLS) [MIM:247200]. MDLS is a form of

Lissencephaly associated with facial abnormalities.

SIMILARITY: Contains 1 LisH domain.

SIMILARITY: Contains 7 WD repeats.

CAUTION: Ref. 1 (AAA02882) sequence differs from that shown due to

CAUTION: Ref. Is sequence differs from that shown due to what seems

to be the presence of intronic sequence in the CDNA.

caused by abnormal neuronal migration at 9 to 13 weeks' gestation. Lissencephaly means 'smooth brain', a brain without convolutions or gyri, and consists in an absence (agyria) or a decrease (pachygyria) of surface convolutions associated with a disorganization of the clear neuronal lamination of normal sixlayered cortex. It is characterized by an abnormally thick and poorly organized cortex with 4 primitive layers, diffuse neuronal heterotopia, enlarged and dysmorphic ventricles, and often hypoplasia of the corpus callosum.

-!- DISEASE: Defects in PARAHIBI are the cause of subcortical band heterotopia (SBH) [MIN:607432]. SBH is at the less severe end of the lissencephaly spectrum of malformations, characterized by bilateral and symmetric ribbons of gray matter found in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EMBL, L13385, AAA02880.1;

Nature 370.216-218 (1994).

1. Nature 370.216-218 (1994).

1. division. Participates in the process of neuronal cell
division. Participates in the process of neuronal cell
division. Participates in the process of neuronal cell
division. Participates on the process of neuronal cell
differentiation of differentiating neurons. May participate
in nuclear migration of differentiating neurons. May participate
in targeting cytoplasmic dynean to the microtubule plus ends,
thereby playing an essential role in dynein-mediated microtubule
sliding. Non-catalytic subunit of a acetylhydrolase complex, a
complex that inactivates platelet-activating factor (PAP) by
removing the acetyl group at the SN-2 position (By similarity).

SUBUNITY: Cytosolic PAP-AH IS is formed of three subunits of 45 kDa
(alpha), 30 kDa (beta) and gamma subunits, whereas the
alpha subunit has regulatory activity. Trimer formation is not
essential for the catalytic activity. Interacts with dynein and
dynactin. Interacts with RSN (By similarity).

--- SUBCELUTAR LOCATION: Cytoplasmic, localizes to the plus end of
microtubules (By similarity).

--- SIMILARITY: Contains 7 WD repeats.
